Professional Summary

Software Engineer I building **scalable backend services, real-time systems, APIs, and data platforms** with Python, Java, SQL, PostgreSQL, and Redis. Experienced improving **performance, scalability, reliability, testing, CI/CD, monitoring, and production operations** for high-volume web applications and distributed systems.

Technical Skills

Programming: Python, Java, Kotlin, TypeScript, JavaScript, SQL
Backend: REST APIs, gRPC, Microservices, Service-Oriented Architecture, Async Processing, Event-Driven Systems
Data: PostgreSQL, MySQL, Redis, DynamoDB, Kafka, Data Modeling, Caching
Cloud & Delivery: AWS, Docker, Kubernetes, GitHub Actions, CI/CD, Linux
Engineering: Data Structures, Algorithms, System Design, Unit Testing, Integration Testing, Code Reviews, Git
Reliability: Monitoring, Observability, Performance Profiling, Load Testing, Live Deployments, Incident Debugging

Experience

Trivia Softwares | Software Engineering Intern — Nov 2021 to Jan 2022

- Reduced order-processing latency by **47%** by redesigning Java service calls, eliminating N+1 SQL queries, adding Redis caching, and batching downstream requests across high-traffic checkout workflows.
- Increased sustained event-processing throughput by **2.8x** by partitioning Kafka consumers, introducing asynchronous processing, and removing serialized work from services handling more than **5M events per day**.
- Reduced production request failures by **36%** by adding idempotency keys, retry policies, timeout handling, circuit breakers, and integration tests across distributed payment and fulfillment workflows.
- Cut release validation time by **45%** by adding unit, integration, and contract tests to GitHub Actions pipelines and automating Docker-based deployment checks before production rollout.

Turito | Software Engineering Intern, Real-Time Systems — Jun 2022 to Oct 2022

- Improved real-time location-update throughput by **62%** by replacing synchronous database writes with batched event ingestion and Redis-backed state for **100K+ concurrent sessions**.
- Reduced database query latency by **51%** by redesigning PostgreSQL indexes, denormalizing read-heavy tables, and moving frequently accessed state into Redis.
- Reduced recurring production incidents by **31%** by instrumenting service latency, error rate, queue depth, and dependency failures with dashboards, structured logs, and automated alerts.
- Improved deployment reliability to **99.7% successful releases** by adding staged rollouts, health checks, rollback automation, and CI validation across Kubernetes-hosted services.

SJSU | Graduate Assistant — Aug 2025 to May 2026

- Increased distributed task throughput by **2.4x** by implementing parallel workers, partition-aware scheduling, asynchronous I/O, and batched persistence across a multi-node Python service.
- Reduced duplicate processing by **94%** by introducing idempotent job execution, durable task states, retry controls, and database-backed deduplication across failure-prone workflows.
- Reduced regression escape rate by **38%** by building unit, integration, load, and failure-injection tests for API, database, concurrency, and recovery paths.
- Cut debugging time by **43%** by adding correlation IDs, structured logging, latency metrics, request traces, and replayable failure scenarios across distributed services.

Relevant Projects

Real-Time Dispatch Engine | *Java, Python, Kafka, Redis, PostgreSQL, AWS*

- Reduced simulated courier-assignment latency by **58%** by combining geospatial candidate filtering, priority-queue ranking, Redis state, and asynchronous dispatch across **50K concurrent delivery requests**.
- Improved successful recovery from injected service failures to **99.5%** by implementing idempotent order transitions, durable Kafka events, exponential retries, dead-letter handling, and database reconciliation.

Marketplace Experiment & Recommendation Platform | *Python, TypeScript, PostgreSQL, Redis, Docker*

- Improved recommendation click-through by **18% in offline simulation** by combining behavioral signals, merchant attributes, geographic features, and ranked candidate retrieval behind a Python API.
- Reduced experiment-analysis time by **64%** by building automated exposure logging, metric aggregation, cohort comparison, and guardrail reporting for conversion, latency, and error-rate experiments.

Education

San Jose State University | M.S. in Computer Science — May 2026
University of Mumbai | B.E. in Computer Engineering — May 2023
